1 Introduction

Definition 1.1 (Continuos). Let (X, d_X) , (Y, d_Y) be metric spaces, $f: X \rightarrow Y$ a map and $x_0 \in X$. We say f is *continuous* in x_0 , if

$$\forall \varepsilon > 0 : \exists \delta > 0 : \forall x \in X : d_X(x, x_0) < \delta \implies d_Y(f(x), f(x_0)) < \varepsilon.$$

Proposition 1.2 (Sequence criterion for continuity). *Let (X, d_X) , (Y, d_Y) be metric spaces, $f: X \rightarrow Y$ a map and $x_0 \in X$. Then f is continuous in x_0 if and only if, for every sequence $(x_n)_{n \in \mathbb{N}}$ in X which converges to x_0 , the sequence $(f(x_n))_{n \in \mathbb{N}}$ converges to $f(x_0)$.*

Proof. A classical proof via a double implication, where each implication is done by proving the contrapositive. $\square$

Definition 1.3 (Limit of a function). Let (X, d_X) , (Y, d_Y) be metric spaces, $\Omega \subseteq X$, $f: \Omega \rightarrow Y$ a map, $x_0 \in X$ an accumulation point of Ω and $y \in Y$. We say f has the *limit* y in x_0 , if

$$\forall \varepsilon > 0 : \exists \delta > 0 : \forall x \in (B_\delta(x_0) \cap \Omega) \setminus \{x_0\} : d(f(x), y) < \varepsilon.$$

In this case we write $\lim_{x \rightarrow x_0} f(x) = y$.

Theorem 1.4 (Limit criterion for continuity). *Let (X, d_X) , (Y, d_Y) be metric spaces, $\Omega \subseteq X$, $f: \Omega \rightarrow Y$ a map and $x_0 \in \Omega$ an accumulation point of Ω . Then f is continuous in x_0 if and only if*

$$\lim_{x \rightarrow x_0} f(x) = f(x_0).$$
